

Facts About Oral Cancer

Oral Cancer is the 6th leading cancer killer in the US

- Every hour of every day, 1 person in the U.S. alone dies from oral cancer.
- When discovered in its early stages, survival rates for oral cancer are extremely high, but when discovered in its later stages, which is normally the case, survival rates become extremely low.

Velscope Oral Cancer Detection System

- This latest advancement allows the dentist to discover oral abnormalities not observed through traditional examinations.
- Velscope allows the dentist to 'make the invisible visible' by detecting potentially cancerous tissues in their earliest stages.

Hi-Tech Family Dentistry now makes this technology available as part of its routine oral examinations.
